

The Role of Water in Planetary Science

March 21, 2007

12:00 noon - 1:00pm

Discussion of associated readings afterward (1pm-2pm)

To see the list of associated readings, go to the CIPS website: <http://cips.berkeley.edu/events>

**WHAT MAKES WATER WET:
AN OVERVIEW OF THE MOLECULAR LEVEL
PROPERTIES OF WATER**

Jared Smith

Lawrence Berkeley Lab

The unique chemical and physical properties of liquid water are a direct result of its highly directional hydrogen-bond network structure and associated dynamics. However, despite intense experimental and theoretical scrutiny spanning more than four decades, a coherent description of this network remains elusive. Here I would like to give a brief overview of the many unique properties of liquid water, and how these properties are thought to be related to the molecular level structure. Furthermore, I will also discuss recent experimental and theoretical work which has led to both controversy and new insights into this ubiquitous system.

Weekly seminars organized by Mate Adamkovic (Astronomy) & Sarah Zaranek (EPS) & sponsored by CIPS.
